Caci Promotion

Only £280 for 6 full CACI sessions
(includes jowl lift)

The award winning CACI micro current system is synonymous of non surgical facelift and has a vast array of celebrity devotees. Using micro current facial techniques the CACI Quantum works to restore and redefine facial muscles, reducing lines and wrinkles.

CACI is a renowned facelift favoured by clients to re-educate and lift the facial muscles, reducing lines and wrinkles whilst toning sagging muscles and skin, producing immediate and dramatic results.

EFFECTS OF TREATMENT:

•**Crows feet and eye bags:** Your eyes are surrounded by a network of fine, narrow muscles supporting the skin in an area which is particularly fragile. CACI will contract these muscles, improving the circulation in the peripheral blood vessels, thereby reducing the sagging and restoring a healthier skin tone.

•**Wrinkles on forehead:** The vertical muscles that support the skin of the forehead are rarely used; therefore, they do not adequately stimulate the blood vessels, for proper irrigation of the epidermis. Frowning will stimulate these muscles, but the creases that result will cancel out any irrigation. With CACI you can exercise these muscles in a beneficial way, improving the skin tone and reducing wrinkles

•**Creases around the mouth:** Between the cheeks and nose, there is a long muscle called the "joint elevator of the nasal wing and upper lip". This muscle works in a downward direction, as a rule gradually forming a deepening, vertical crease in this area. CACI will cause this muscle to work upwards, creating better support for your skin and progressively reducing the creases.

•**Sagging chin:** whenever you chew, you are using the muscles around the jaw bone, called masseters. To correct any sagging under the chin, the muscles called the quadratus and the triangularis must be exercised. These are not used during the chewing process. CACI stimulation causes these muscles to contract, tightening up any slackness under the chin.

•**Improve complexion:** Beneath the facial skin, there is a complex network of muscles and elastic tissue, whose function is to support the epidermis, and stimulate the peripheral blood vessels, ensuring that the skin's foundation is well irrigated. Regular CACI treatments improve and maintain the efficiency of this "skin feeding system" and achieve a visible improvement to the complexion.
